

Circulation pressure control and relief regulator VAR

TECHNICAL INFORMATION

- Circulation pressure control and relief regulator for gaseous media in all types of gas appliances
- High flow rate due to optimal dimensioning
- No purge line required
- Internal impulse

1 Application

VAR..R

VAR..F

Relief regulator VAR is suitable for maintaining constant pressures in gas appliances or for relieving brief pressure surges in control systems. By using the VAR, inadmissibly high pressures in vessels can be prevented.

Compressors and fans generate different outlet pressures in the case of different capacity demands. These fluctua-

tions can be controlled by discharging a bypass flow from the outlet to the inlet of the compressor unit. Downstream consumers thus dispose of constant pressure over the entire capacity range.

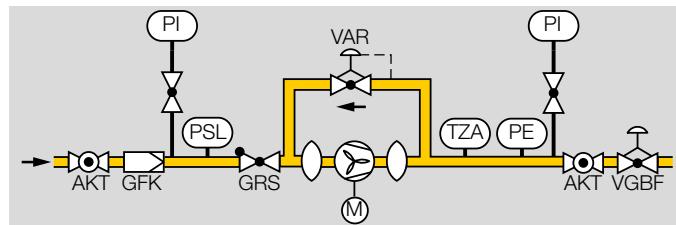

1.1 Application examples

1.1.1 Gas booster system

Industrial thermoprocessing equipment or combined heating and power plants in which the supply pressure is too low must be fitted with gas pressure boosters. The speed of the compressor and thereby the change in the outlet pressure or flow rate is controlled by a frequency converter. The frequency-controlled compressor allows a high turn-down. The control system includes the safety interlocks (limits) with temperature and pressure monitoring.

The gas pressure boosters are designed for an operating pressure of up to 1 bar and an output capacity of max. 50 kW in accordance with DVGW Code of Practice G 620.

Gas pressure booster flowchart

If the pressure downstream of the fan is too high, circulation pressure control regulator VAR opens and routes the medium back to the inlet area.

2 Certification

The regulator complies with the essential health and safety requirements of the corresponding chapters in Annex 2 of the Machinery Directive 2006/42/EC in conjunction with EN 13611.

Approval for Russia

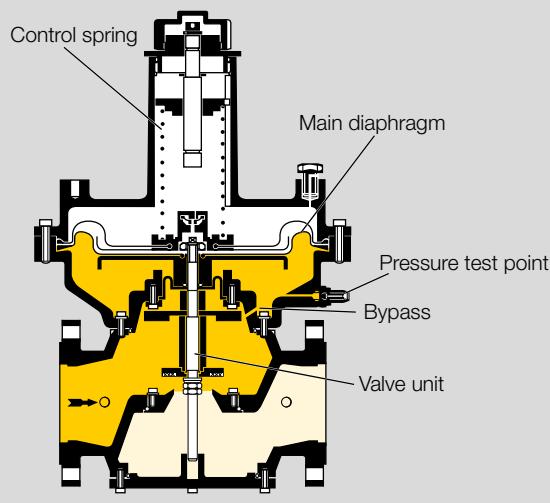

Certified by Gosstandart pursuant to GOST-TR.

Approved by Rostekhnadzor (RTN).

Scan of the approval for Russia (RUS) – see www.docuthek.com

3 Function

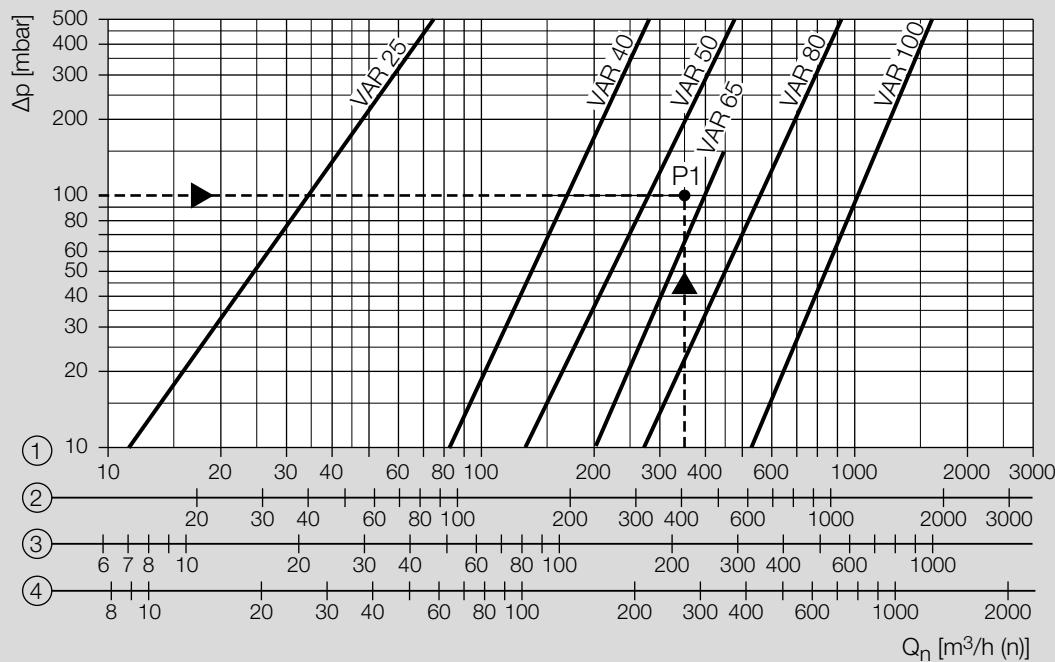

Circulation pressure control and relief regulator VAR is closed by a spring when no pressure is applied.

The gas flows from the inlet side into the space under the working diaphragm via the internal impulse bore. If the inlet pressure reaches the pressure set by the control spring, the diaphragm raises the valve unit. Regulator VAR opens and the gas can flow to the outlet.

If the inlet pressure has decreased due to the gas flowing out, the regulator closes.

A test nipple has been installed to measure the opening pressure p_{as} .

4 Flow rate

1 = natural gas ($\rho = 0.80 \text{ kg/m}^3$)

2 = town gas ($\rho = 0.58 \text{ kg/m}^3$)

3 = propane ($\rho = 2.01 \text{ kg/m}^3$)

4 = air ($\rho = 1.29 \text{ kg/m}^3$)

Reading instructions: should operating cubic metres (Q_b) have been used in the flow rate diagram, instead of standard cubic metres (Q_n), then the pressure loss read (Δp) must be multiplied by the absolute inlet pressure in bar (1 + positive pressure in bar).

Example: a circulation pressure control regulator should keep the outlet pressure of a gas pressure booster constant.

Medium: natural gas

Flow rate $Q = 350 \text{ m}^3/\text{h}(n)$

Opening pressure $p_{as} = 120 \text{ mbar}$

System inlet pressure: $p_{counter} = 20 \text{ mbar}$

The natural gas is discharged against the inlet pressure $p_{counter}$ of the system.

Flow rate

$$\Delta p = p_d - p_{\text{counter}}$$

$$\Delta p = 120 \text{ mbar} - 20 \text{ mbar} = 100 \text{ mbar}$$

The result is intersection P1 in the flow rate diagram. The next largest regulator must be selected: VAR 65.

4.1 Calculating the nominal size

A web app selecting the correct product is available at

www.adlatus.org.

5 Selection

Option	VAR 25	VAR 40	VAR 50	VAR 65	VAR 80–100
DN	25	40	50	65	80, 100
Pipe connection	R	R, F	F	F	F
Inlet pressure	05	05	05	05	05
Opening pressure	-1, -2	-1, -2	-1, -2	-1	-1, -2
Special adjusting range	Z	Z	Z	Z	Z

Order example

VAR 40F05-2

5.1 ProFi

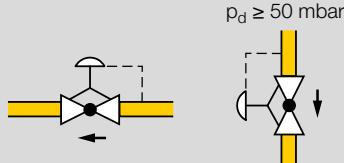

A web app selecting the correct product is available at
www.adlatus.org.

5.2 Type code

VAR	Circulation pressure control and relief regulator
25–100	Nominal sizes
R	Rp internal thread
F	Flange to ISO 7005
05	p_u max. 500 mbar
-1	Opening pressure p_d 10–150 mbar
-2	Opening pressure p_d 151–340 mbar
Z	Special adjusting range

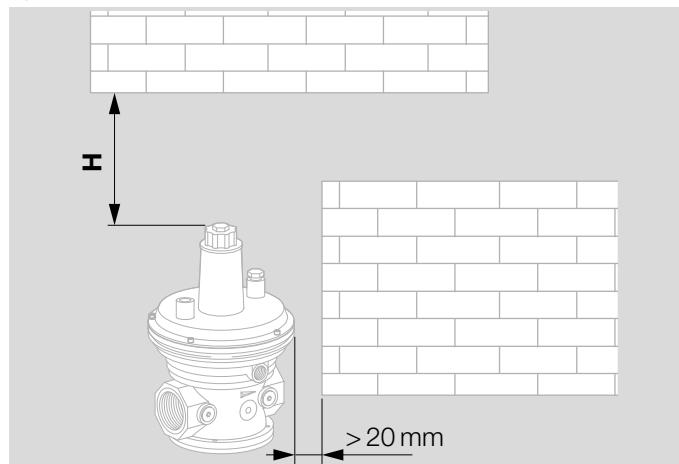

6 Project planning information

6.1 Installation

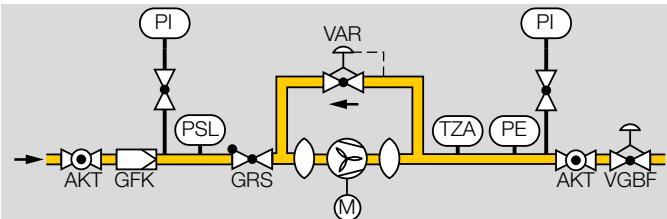

Installation position: spring dome in the vertical upright position, not upside down.

With opening pressures of > 50 mbar: spring dome in the vertical upright position or tilted up to the horizontal, not upside down.

The VAR must not be in contact with masonry. Minimum clearance 20 mm. Ensure that there is sufficient space for installation and for changing the spring **H**:

Type	Distance H [mm]
VAR 15	120
VAR 25, VAR 40	180
VAR 50	200
VAR 65, VAR 80	320
VAR 100, VAR 150	360

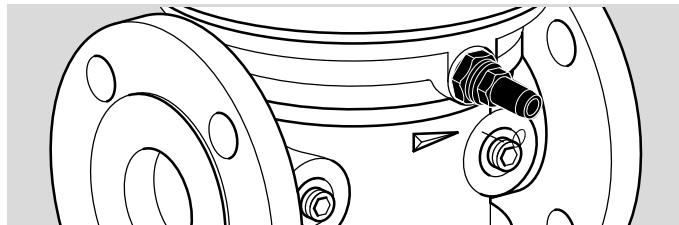

The use of bellows units or flexible tubes (A) allows for the installation in pipelines under little mechanical stress and reduces the transmission of vibrations.

Sealing material and dirt, e.g. thread cuttings, must not be allowed to get into the regulator housing.

Install a filter upstream of every system.

Do not store or install the unit in the open air.

The unit is delivered with a test nipple fitted to the side to measure the inlet pressure p_u or opening pressure p_{as} . Circulation pressure control and relief regulators must be designed as small as possible to maintain good control.

characteristics see page 7 (Flow rate). It may be necessary to expand the pipeline to avoid flow velocities of ≥ 30 m/s in pipelines.

7 Technical data

Gas types: town gas, natural gas, LPG (gaseous) and biogas (max. 0.02 %-by-vol. H₂S). The gas must be dry in all temperature conditions and must not contain condensate.

Inlet pressure p_{u max}: 500 mbar.

Ambient temperature: -15 to +60°C.

Internal thread: Rp to ISO 7-1.

Flanged connection: PN 16 to ISO 7005.

Housing: aluminium,
diaphragms: Perbunan,
valve seat: aluminium,
valve stem: aluminium,
valve plate: Perbunan.

7.1 Spring table

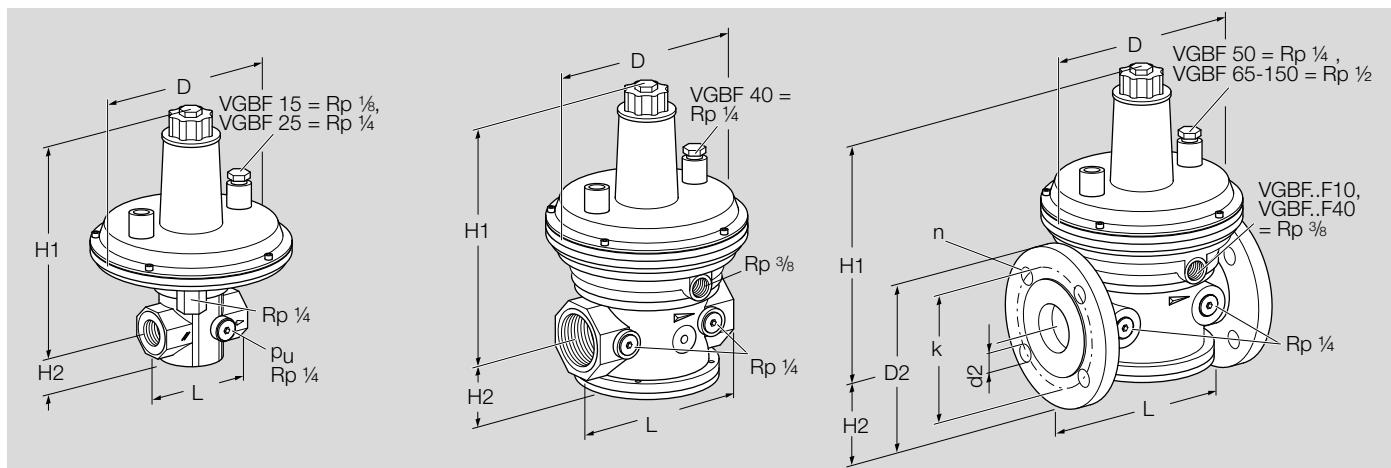

The opening pressure p_{as} is adjusted by inserting different springs.

Opening pressure range p [mbar]	Marking	Order No.				
		VAR 25, VAR 40	VAR 50	VAR 65	VAR 80	VAR 100
